# ANTIDIABETIC

Drugs used in diabetes treat diabetes mellitus by lowering glucose levels in the blood. With the exceptions of Insulin, exenatide, liraglutide and pramlintide, all are administered orally and are thus also called oral hypoglycemic agents or oral antihyperglycemic agents. There are different classes of anti-diabetic drugs, and their selection depends on the nature of the diabetes, age and situation of the person, as well as other factors.

## Below listed the Orbit's Portfolio

NAME
Metformin Tablets BP 500 mg
